

THEY'RE LEGAL & THEY GET YOU HIGH!

LEGAL HIGHS

TEN TIPS FOR SAFER USE

A GUIDE FOR PEOPLE IN
MENTAL HEALTH UNITS

LINNELL RESEARCH CHEMICALS LTD.

LEGAL HIGHS & MENTAL HEALTH

Legal highs are substances that can often cause a bad effect on your mental health instead of the desired good effect.

- Legal highs can make a low mood lower.
- Legal highs can make paranoia and anxiety much worse.
- These bad, negative or unwanted effects don't always happen straight away. The immediate or initially good effects of legal highs are often remembered by people but because the negative effects are delayed these are often forgotten.
- Legal highs mixed with other medication can be dangerous.

- Legal highs may contain ingredients or chemicals that are dangerous and could lower or increase your blood pressure. Legal highs may affect your breathing. Mixed with alcohol or medication they could lead to heart problems, stroke or even a heart attack.

LEGAL HIGHS

& MENTAL HEALTH UNITS

When you are admitted to hospital the nurses and doctors have a ‘*duty of care*’ towards you and the ward as a whole. This means they must ensure that the ward is safe and that the patients on the ward don’t do anything that may risk their health.

When you are suffering from mental health problems taking legal highs is risky. The effects are very similar to taking any illegal drugs, too many over the counter drugs or drinking alcohol.

On admission to a mental health ward nurses and doctors will talk with you about any substance use. They will provide expert help and advice to help you stop or stay stopped.

The hospital must not allow any drug or alcohol use. If any drug or alcohol use occurs nurses and doctors can work with the hospital security and/or the police to ensure the ward environment is safe and drug and alcohol free.

Please do your best to keep the wards safe, yourself safe and your fellow patients safe.

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 1 Know the law

If the police search you and find a ‘*legal high*’, they are supposed to act like it is an illegal (*controlled*) drug, arrest you and take you to the police station. If the *legal high* is tested and found to contain no illegal drugs, you will not be charged with any offence.

About 1 in 10 *legal highs* have been found to contain illegal drugs – usually drugs that were *legal highs* but have since been banned.

A *legal high* can become subject to a new law called a **Temporary Class Drug Order** (TCDO). This means that the dangers of that drug are studied for a year, during which time it is illegal to supply the drug – however, *possession* (being caught with the drug) is not an offence during this period.

New laws are planned which are designed to stop the open sale of ‘*legal highs*’. These plans will not make the possession of ‘*legal highs*’ an offence, just the sale of these substances.

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 2 *Don't trust suppliers*

What it says on the label is not always what's in the packet.

Some packets of *legal highs* do not say what they contain or do not contain what they say they do.

Not every packet will contain the **same drug** in the **same dose**, even if it is a brand you have used before.

Some suppliers are better than others. Nice packaging is no guarantee that the *legal high* is safe or contains what it says on the packet.

Most of the *legal highs* on sale in shops and from websites are legal. About 1 in 10 packets have been found to contain illegal drugs – usually former *legal highs* that have since been banned.

TOXIC

*Legal highs are not safe to use and may make you very ill.
Many are stronger and last longer than illegal drugs - it is
sensible to assume they are just as dangerous.*

Legal Highs are HARMFUL and can KILL.

NOT FOR HUMAN
CONSUMPTION

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 3 *Understand the risks*

It says “**Not for Human Consumption**” on the packet, because *legal highs* have never been tested on humans.

It says “**Harmful**” on the packet, because *legal highs* can make you very ill and have killed people. The deaths of over 100 people in the UK have now been linked to the former *legal high Mephedrone*.

Some *legal highs* are stronger and last longer than illegal drugs – it is sensible to assume they are just as dangerous. *Mixing legal highs*, other drugs and/or alcohol increases the risks.

Legal highs are not safe for anyone to use. It says “**Not for Sale to under 18s**” on the packet, because they are particularly dangerous for young people, pregnant women, people with mental health issues, heart problems, high blood pressure or any sort of serious illness.

TEN TIPS FOR SAFER USE

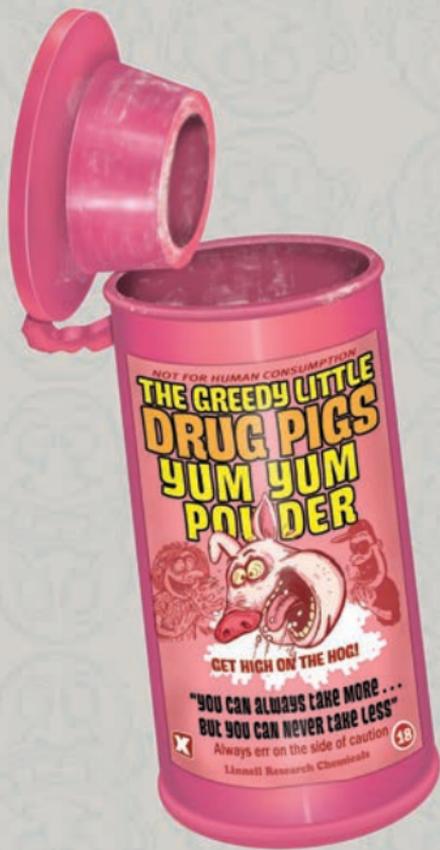

No. 4 **Do your research**

Try and find out as much as you can about a *legal high* before you use it: what are the effects; what the risks are likely to be; what dose do you take and how long does it last.

Ask friends who have used it before. Look it up on User Forums, *Wikipedia* or websites such as **www.erowid.org**.

Don't use alone – it is safer to have somebody with you. Talk with friends about what you would do in an emergency. Don't use *legal highs* anywhere hazardous – like a riverbank or the side of a motorway – find a safe place.

Eat at least an hour before you use. Go to the toilet. Have *condoms* handy – some *legal highs* can make some people very aroused. Don't plan to take a bath – people have drowned after falling asleep while high. Don't make any plans to drive a car.

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 5 Don't be a 'drug pig'

The most common mistake made when taking a *legal high* is to underestimate the strength and take too much.

Start with a test dose, a tiny line or pinch of powder. Try half a pill or capsule before you take a whole one. Always err on the side of caution. As the old saying goes, "*You can always take more – but you can never take less*".

Some *legal highs* can take more than an hour before you get the full effect, while others come on in waves of intensity. If you do intend to re-dose, wait at least an hour for the effects to start before you take more.

Many *legal highs* last 12 hours or more and it can be days before you feel normal again. Plan ahead for where you will be while you are high and where you will or plan to be during your recovery.

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 6 Avoid heatstroke

Stimulant type *legal highs* can cause heart problems, raise blood pressure and lead to dangerous overheating (*Heatstroke*).

Heatstroke can kill – take regular sips of water, especially if dancing. If overheating – cool down any way you can: drink water (no more than a pint); splash it on your face; remove clothes; go outside. If your urine is dark, you can't pee or stop sweating – ring for an ambulance.

Heart – if you have a sharp pain in the chest – sit down and rest. Go to A&E or ring for an ambulance.

Don't share straws or tooters: chop powder as fine as possible; rinse your nose after use. Sugar free gum is good for jaw clenching. Put up with the come-down – remember, “*there is no such thing as a free buzz*”. The come-down is the price you pay for getting high.

DROP ONE AND WAIT FOR IT TO ...
BLOW YOUR MIND

BRAIN GRENADES

Legal highs can have a range of effects, from distortions in the way you think, feel, and experience the world around you – to full blown hallucinations.

Find out about a legal high before you take it.

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 7 *Don't use alone*

Mind-bending *legal highs* can have a range of effects, from distortions in the way you think, feel, and experience the world around you – to full blown *hallucinations*.

Effects can last from a few minutes to 12 hours or more, with a come-down lasting days.

If you are going to take mind-bending *legal highs* – pick somewhere where you feel safe and can relax. Don't use on your own – it is a good idea to have somebody stay '*straight*' to calm and reassure you if needed and to stop you doing anything dangerous.

If **panic attacks** or **paranoia** start. Try to stay calm. Slow your breathing down or breathe into a paper bag. Reassure and calm friends. Tell them that the experience is drug induced and will not last forever.

TEN TIPS FOR SAFER USE

No. 8 *A pinch is enough*

Synthetic cannabis is an ordinary plant, sprayed with a chemical (a *synthetic cannabinoid*). A pinch of synthetic cannabis the size of a match head is an active dose. Some brands are stronger than others and are very different from real cannabis. Some brands can be frighteningly strong, taking you to what feels like another reality.

Synthetic cannabis can cause **breathing difficulties, racing erratic heartbeat, severe rashes, vomiting, unconsciousness, kidney damage** and even death. If you experience any serious symptoms – stay calm and call for an ambulance.

A number of synthetic cannabinoids have been banned and there are plans to ban even more of them. However, suppliers simply swap to other synthetic cannabinoids that are still legal and carry on selling them.

You won't test positive for real cannabis if you smoke synthetic cannabis, but tests for synthetic cannabis are becoming more common.

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 9 *Look after your mates*

It is a good idea to talk through with friends what you would do in an emergency. Look after friends in the way you would want them to look after you. Calm and reassure anybody who is panicking or getting paranoid. Take them somewhere quiet.

If unconscious and can't be woken, lay them on their side to stop them choking on their vomit (the *recovery position*). Call an ambulance. If they have stopped breathing give heart massage if you know how.

Calling an ambulance may save their life. You don't have to mention drugs, just say the person is unconscious. Try to stay calm when calling for ambulances. It is important to tell the paramedics or doctors what drug or *legal high* has been taken.

LEGAL HIGHS

TEN TIPS FOR SAFER USE

No. 10 Ask for help

Legal highs can be stronger and last longer than illegal drugs. They are as dangerous as illegal drugs – they may be even more dangerous.

We are learning about the short term effects of some *legal highs*, but we know absolutely nothing about the long term effects – nobody does, no one has ever used them long term – ever.

What the effects of using legal highs regularly for weeks, months or even years will be is totally unknown.

We know that some people start to use more and more, max out the credit card or wait outside for the head shop to open. They develop a *legal high* habit.

If you are beginning to recognise or admit to yourself that your use of *legal highs* is becoming a problem – ask for help. There are free, confidential services in your area.
